

## CN LAB CYCLE 2

### 1. Write a program for error detecting code using CRC-CCITT (16 bits).

```
import java.util.*;
public class Main{
    public static int n;
    public static void main(String[]
        args){ Scanner in=new
        Scanner(System.in); Main ob=new
        Main();
        String code, copy, rec,zero="0000000000000000";
        System.out.print("Enter poly: ");
        code=in.nextLine();
        System.out.println("Generating polynomial: 10001000000100001");
        n=code.length();
        copy=code;
        code+=zero;
        System.out.println("Modified poly: "+code);
        code=ob.divide(code);
        System.out.println("Checksum: "+code.substring(n));
        copy=copy.substring(0,n)+code.substring(n);
        System.out.println("Final Codeword: "+copy);
        // System.out.print("\nEnter recived data: ");
        // rec=in.nextLine();
        // if(zero.equals(ob.divide(rec).substring(n)))
        // System.out.println("Correct bits recieved");
        // else
        // System.out.println("Recieved frame contains one or more
errors");
        System.out.print("Test Error detection 0(yes) 1(no)? : ");
        int choice = in.nextInt();
        if(choice == 0){
            System.out.print("Enter position on error: ");
            int errorPos = in.nextInt();
            if(copy.charAt(errorPos) == '1')
                copy=copy.substring(0,errorPos) + "0" + copy.substring(errorPos+1);
```

```

        else
            copy = copy.substring(0,errorPos) + "1" +
copy.substring(errorPos+1);
            System.out.println("Errorneous data: "+copy);
            System.out.println("Error detected");
        }
        else
            System.out.println("No Error detection");
    }
    public String divide(String
s){ int i,j;
    char x;
    String div="100010000000100001";
    for(i=0;i<n;i++){ x=s.charA
        t(i); for(j=0;j<17;j++){
            if(x=='1'){
                if(s.charAt(i+j)!=div.charAt(j))
                    s=s.substring(0,i+j)+"1"+s.substring(i+j+1);
                else
                    s=s.substring(0,i+j)+"0"+s.substring(i+j+1);
            }
        }
    }
    return s;
}
}

```

OUTPUT:

```

Enter poly: 1011101
Generating polynomial: 10001000000100001
Modified poly: 101110100000000000000000
Checksum: 1000101101011000
Final Codeword: 10111011000101101011000
Test Error detection 0(yes) 1(no)? : 0
Enter position on error: 2
Errorneous data: 10011011000101101011000
Error detected

...Program finished with exit code 0
Press ENTER to exit console.

```

**2. Write a program for distance vector algorithm to find suitable path for transmission.**

```
#include<stdlib.h>

#### 4. Write a program for congestion control using Leaky Bucket algorithm.

```

#include<stdio.h>
#include<stdlib.h>
#include<unistd.h>
#define NOF_PACKETS 5
/*
int rand (int a)
{
    int rn = (random() % 10) % a;
    return rn == 0 ? 1 : rn;
}
*/
/*
#include <stdlib.h>
long int random(void);

```

The random() function uses a nonlinear additive feedback random number generator employing a default table of size 31 long integers to return successive pseudo-random numbers in the range from 0 to RAND\_MAX.

The period of this random number generator is very large, approximately  $16 * ((2^{31}) - 1)$ .

```
*/
int main()
{
int packet_sz[NOF_PACKETS], i, clk, b_size, o_rate, p_sz_rm=0, p_sz,
p_time, op;
for(i = 0; i<NOF_PACKETS; ++i)
packet_sz[i]=random()% 100;
for(i=0; i<NOF_PACKETS; ++i)
printf("\npacket[%d]:%d bytes\t", i, packet_sz[i]);
printf("\nEnter the Output rate:");
scanf("%d", &o_rate);
printf("Enter the Bucket Size:");
scanf("%d", &b_size);
for(i = 0; i<NOF_PACKETS; ++i)

print ("\nReply from Server:\n")
print (filecontents.decode("utf-8"))
# for i in filecontents:
    #print(str(i), end =")
clientSocket.close()
clientSocket.close()
```

### ServerUDP.py

```
from socket import *
serverPort = 12000
```

```

serverSocket=socket(AF_INET,SOCK_DGRAM)
serverSocket.bind(("127.0.0.1", serverPort))
print ("The server is ready to receive")
while 1:
    sentence, clientAddress = serverSocket.recvfrom(2048)
    sentence = sentence.decode("utf-8")
    file=open(sentence,"r")
    l=file.read(2048)

    serverSocket.sendto(bytes(l,"utf-8"),clientAddress)

    print ('\nSent contents of ', end = ' ')
    print (sentence)
    # for i in sentence:
        # print(str(i),end="")
    file.close()

```

## OUTPUT:

The image shows two side-by-side screenshots of the Python IDLE Shell 3.10.1 interface. The left window displays the source code of a Python script named 'ServerUDP.py'. The code sets up a UDP server on 127.0.0.1:12000, receives data from a client, decodes it from UTF-8, reads it from a file, and sends it back to the client. The right window shows the output of the script, which prints 'The server is ready to receive' and 'Sent contents of ServerUDP.py'.
